Module 5 Instructions

After completing Module 5, students should be able to:

1. Outline the steps in the forecasting process
2. Describe qualitative vs. quantitative forecasting techniques
3. Prepare forecasts with Naïve, Moving Average (MA), Weighted MA, and Exponential Smoothing
4. Calculate forecast error measures including BIAS, MAD, MSE, and control charts
5. Prepare a forecast using Linear Regression for Time Series that have a significant trend
6. Interpret the Excel output of a Linear Regression using the Data Analysis add-in in Excel
7. Expand their knowledge of current topics in operations management and supply chain

Module 6 supports the following course learning objectives

1. Define the different terms in Operations Management
2. Describe the difference between Operations and Supply Chain Management
3. Describe the assumptions, inputs, and outputs of the different quantitative models
4. Solve problems using the right decision making model and interpret the results
5. Explain the difference(s) between optimal and heuristic (rule of thumb) solutions

Instructions

1. Read Chapter 3 and the corresponding Power Point slides
2. Do the Practice Problems for Chapters 3
3. Listen to the Voice Over Examples for Chapters 3
4. Look at the different examples in Excel (Optional)
5. Complete and Submit HW3
6. Post to Discussion 2
